

EPA has a new version of WARM

- And a new report on landfill methane emissions
- The new report puts together the pieces from old data
- It is terrific to see the agency put 2+2 together

Giant step

<https://www.biocycle.net/connections-food-waste-and-landfill-methane-report-a-giant-step-on-a-long-road/>

Food scraps are your ideal feedstocks for making methane

- Food scraps contain the perfect blend of moisture and nutrients
- They decompose readily
 - Just look in the back section of your refrigerator
- Because they are so wet (75% water) this decomposition gets smelly fast
- Odor indicates anaerobic conditions

US EPA Waste Reduction Model

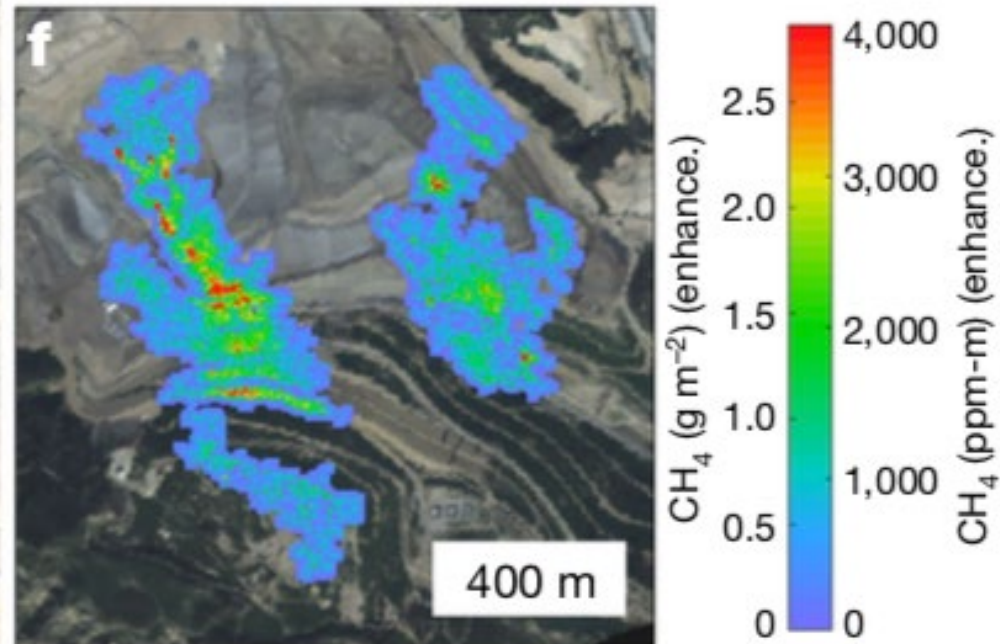

About a 1:1 balance between food scraps in and CO₂e out (as CH₄)
And that estimate is based on old, very conservative data

Their landfill emissions were also based on estimates
Recent studies have actually found the gas

California's methane super-emitters

So I applaud your entry into what I'd call it an 'elite' group

And remind you where you can read all about benefits associated with your elite membership

composting could avoid methane emissions from landfills equivalent to 2.3 gigatons of carbon dioxide by 2050.

That total excludes additional gains from applying compost to soil.

COMPOSTING

Connections: Can Compost Draw Down Carbon?

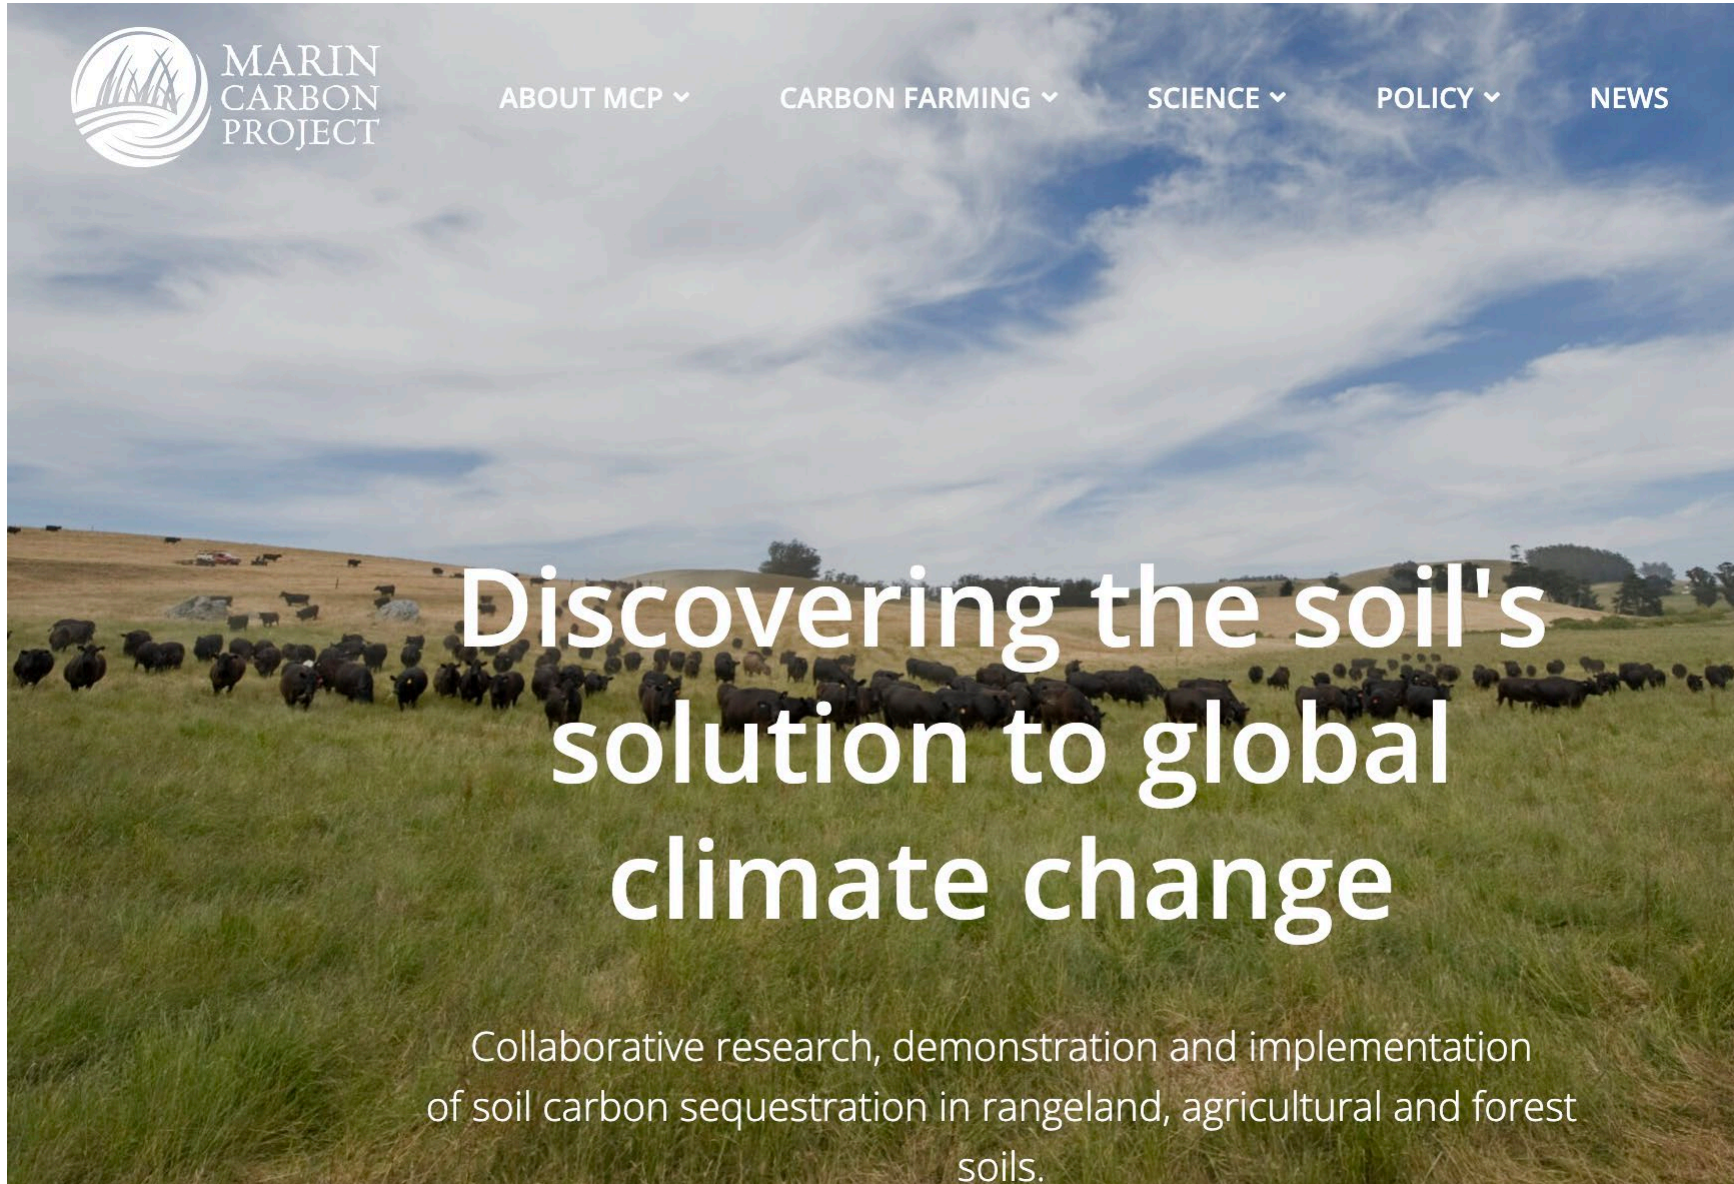

Series examines all the ways compost reduces CO₂ in the atmosphere. Part I

Sally Brown

<https://www.biocycle.net/connections-can-compost-draw-carbon/>

But your coolness only starts with CH₄ avoidance

The image shows a screenshot of the Marin Carbon Project website. At the top left is the logo, which consists of a circular emblem with stylized grass and waves, followed by the text "MARIN CARBON PROJECT". To the right of the logo is a navigation menu with five items: "ABOUT MCP", "CARBON FARMING", "SCIENCE", "POLICY", and "NEWS", each with a small downward arrow. The main content area features a large photograph of a herd of black cattle grazing in a green field under a blue sky with scattered white clouds. Overlaid on this image is the main title "Discovering the soil's solution to global climate change" in a large, white, sans-serif font. Below the title is a subtitle in a smaller, white, sans-serif font: "Collaborative research, demonstration and implementation of soil carbon sequestration in rangeland, agricultural and forest soils."

Discovering the soil's solution to global climate change

Collaborative research, demonstration and implementation of soil carbon sequestration in rangeland, agricultural and forest soils.

Soil carbon sequestration has been seen as a critical tool for both climate change and soil health

Regenerative agriculture requires healthy soil

Soil health = increased soil carbon

Soil Health is the Foundation for Regenerative Agriculture

Let's create a healthier future

The newly established U.S. Regenerative Cotton Fund encourages the adoption of soil health management systems across more than 1 million acres of U.S. cotton cropland to mitigate the effects of climate change, improve cotton producers' livelihoods, and create a more resilient

U.S. REGENERATIVE COTTON FUND

SOIL HEALTH

<https://soilhealthinstitute.org/>

Soil is now sexy

- Maybe not exactly in a Sydney Sweeny kind of way
- More of a save the planet and continue to eat kind of way

And just to let you know that I've been around for awhile

You have start ups focused on soil

Stanford junior wins 2021 Congressional Medal of Honor Society Service Award - Stanford Today
stanford.io

And now there are movies

- From Josh Tickell, one of America's most celebrated documentary filmmakers, comes a "fascinating, easy-to-follow blueprint for how eating in ways that nourish and regenerate the soil can not only help reverse global warming, but also bring greater vitality to our lives" (Wolfgang Puck).

States (CA and WA) now have or are developing soil health initiatives
And compost is an integral part of these

- Yorgey et al. (2017) identified the following as a priority for cropland agriculture in the PNW: Develop technical or other approaches to overcome existing barriers to increasing organic inputs (e.g., compost, manure, biosolids, biochar) in cropping systems, to support adoption of practices with substantial potential to increase carbon sequestration across the region.

Why Compost?

No- till agriculture

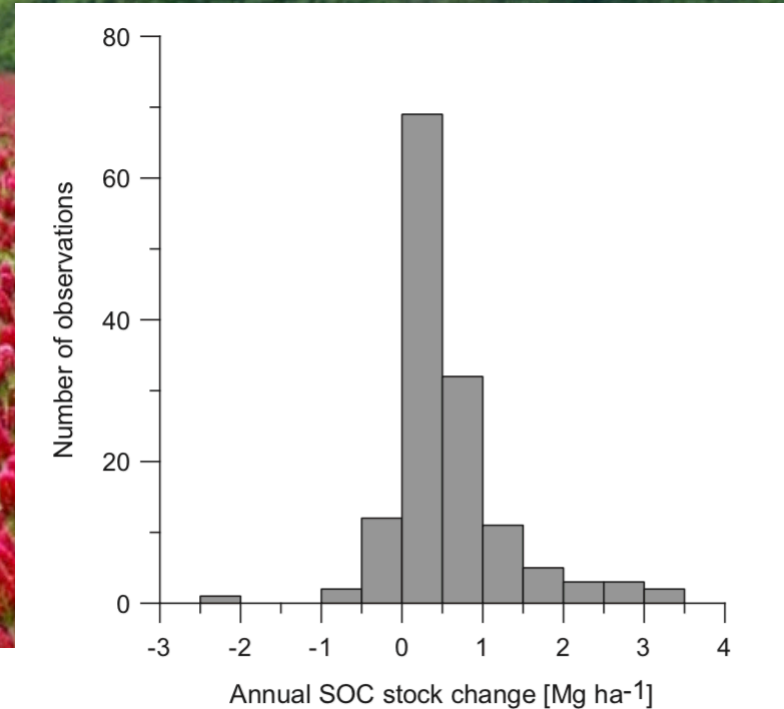

- Had been the big answer
- Meta studies (compilation of all studies) show benefits limited to surface
- Most cases you borrow from the bottom

Cover Crops

(Poeplau and Don, 2015)

- Cover crops
 - Meta analysis shows sequestration rates of $0.32 \pm 0.08 \text{ Mg C ha}^{-1} \text{ yr}^{-1}$ with no indication of saturation over the duration of the studies examined
 - Likely higher with more complex crop mixtures

Except a recent study suggests that it too may steal from the bottom

Tautges et al., 2019

- Corn tomato rotation
 - Cover crop +/- poultry manure compost
 - Deep soil sampling
- Cover crop
 - + 1.44 Mg C ha in 0-30 cm
 - - 14.9 Mg C ha in 30-200
- Cover crop + poultry manure compost
 - + 21.8 Mg C ha 0-200 cm

EOM- exogenous organic matter
The proven alternative for soil carbon and soil health

Levavasseur et al., 2020

- AMG model- range of European field trials
 - Report 'h' or fraction of added C that stays put
 - Biosolids 66%
 - Green waste compost 100%
 - MSW Compost 82%

USDA- NRCS

United States Department of Agriculture

336-CPS-1

Natural Resources Conservation Service
CONSERVATION PRACTICE STANDARD
SOIL CARBON AMENDMENT

CODE 336

(ac)

DEFINITION

Application of carbon-based amendments derived from plant materials or treated animal byproducts.

PURPOSE

Use this practice to accomplish one or more of the following purposes:

- Improve or maintain soil organic matter.
- Sequester carbon and enhance soil carbon (C) stocks.
- Improve soil aggregate stability.
- Improve habitat for soil organisms.

COMET- US Carbon model

- Focus on agronomic crops
 - Cover crops
 - No till
- Limited to no mention of EOM at least prior to Marin Carbon and outside of CA

Evaluate Potential Carbon Sequestration and Greenhouse Gas Reductions from Adopting NRCS Conservation Practices

COMET-Planner for the CDFA Healthy Soils Program estimates greenhouse gas reductions and approximates program payments associated with NRCS Conservation Practices included in the program. NRCS Conservation Practices included in COMET-Planner are only those that have been identified as having greenhouse gas mitigation and/or carbon sequestration benefits on farms and ranches. This list of conservation practices is based on the qualitative greenhouse benefits ranking of practices prepared by NRCS.

This tool has been developed to support programs coordinated by the CDFA and the California Air Resources Board (CARB), and contains information on conservation practices eligible under the HSP. For information on an expanded list of conservation practices, see the COMET-Planner tool.

Carbon and greenhouse gas evaluation for NRCS conservation practice planning

1 Project Name and County

Begin by naming your project and selecting your county

Project Name

County

 | ▾

2 Agricultural System

Select your Agricultural System

Cropland Management

Orchard or Vineyard

Grazing Lands

3 CPS, CPI, and Payment Scenario

Select a NRCS Conservation Practice Standard, Conservation Practice Implementation, and Payment Scenario associated with conservation planning objectives that best describe your project. You may add multiple practices, including from different agricultural systems, by returning to Step 2

Note: Payment Scenarios may have different payment rates but do not affect GHG reductions

Conservation Practice Standard:

Practice Implementation:

Select Payment Scenario:

- 6 tons/acre
- 7 tons/acre
- 8 tons/acre

Tool Methodology

COMET-Planner Healthy Soils Tool

Approximate Carbon Sequestration and Greenhouse Gas Emission Reductions and Payments Associated with Selected Conservation Practices*

(metric tonnes CO₂ equivalent per year) ⓘ

| NRCS Conservation Practices | Unit Value (acres or feet) | Carbon Dioxide | Nitrous Oxide | Methane | Total CO ₂ Equivalent | Estimated Payment* |
|--|---|----------------|---------------|---------|----------------------------------|--------------------|
|  Compost (C/N > 11) Application to Grazed Grassland, On-farm produced compost - 8 tons/acre ⓘ | <input type="text" value="1"/> Acre(s) | 4 | -- | -- | 4 | \$1,200 |
| Totals | | 4 | -0 | 0 | 4 | \$1,200 |

Excedrin headache # 1: Contamination

Waste Dive

[Composters spend about a fifth of operating costs on contamination, including plastic](#)

The Composting Consortium report, which analyzed feedstock and finished product from 10 facilities around the country, aims to address common assumptions about plastic and other contaminants in compost. (33 kB) ▾

<https://www.mill.com/>

Zero waste. Zero work.

Some inventions change our lives.
The dishwasher. The clothes dryer.
And now, Mill — the food recycler that
works while you sleep.

[Buy now](#)

[Learn more](#)

Then there is that other feedstock

Municipal biosolids are much richer in nutrients, more consistent and lower in contaminants than food scraps

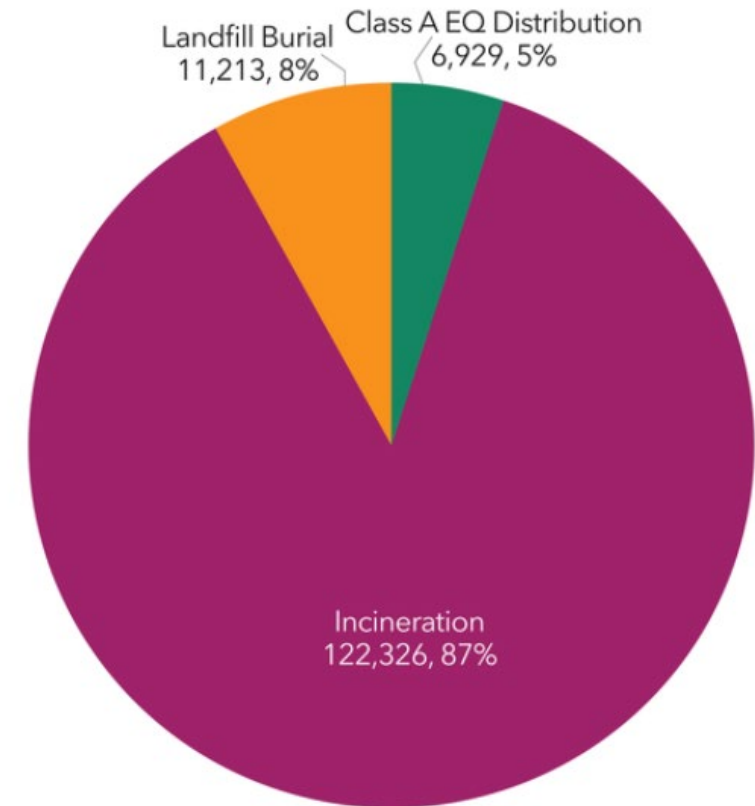

PS- food scraps have PFAS too

140,000 dry tons Most of them crisped

- 122,326 tons incinerated
 - CO₂e = 125,600 MT
- 11,213 tons landfilled
 - CO₂e = 29,600 MT

Connecticut
Biosolids Use & Disposal 2018
(dry US tons, %)
Total: 140,000

CT 3.6 million people

- Say 100 wet lbs food waste per person (45 kg)
- Say you have 100% capture
 - (say that I'm 6' tall and a marathon runner)
- 3.6 million people * 45 kg food scraps per person / 1000 kg per Mg
= 162,000 tons CO₂e from food scrap diversion

Burning or landfilling biosolids emits 155,200

Better hurry up and finish lunch- you've got work to do

Nutrient Management

'the only means to confront the decline in reserves (other than conversion from domestic to imported P) is to develop a more coherent and integrated program of P (and other nutrient) re-cycling.'

Amundson et al., 2015 Science

Drawdown says

- Using fertilizers (N) properly (not to excess) can reduce emissions by 2.3-12.1 gigatons (billion) of CO₂
- They recommend the '4 Rs'
 - Right source
 - Right time
 - Right place
 - Right time

Standard fertilizer

- Nutrients are very carbon intensive to produce
 - 4 kg CO₂ for each kg N
 - 2 kg CO₂ for each kg P

What about people and cows? Take California

- 1.8 million cows
- 54 000 tons of N
- 39 million people
- Food scraps = 39 000 tons of N
- Biosolids = 58 500 tons of N

<https://www.biocycle.net/connections-much-nitrogen-eat/>

California- our source of fruits, nuts and vegetables

- Uses about 700 000 tons of N fertilizer
- Compost and cow poop could meet about 20% of that demand saving over 600 000 tons of CO₂ annually

Tacoma, WA

Metson et al. (2016)

- Phosphorus in the corn belt

All of the P needed to grow corn is available from local recycled sources
